Bank data validation, why?

INTRO

Thanks for downloading our FREE guide to bank data validation. Here we share some industry insights and outline why your business should be including a data validation process in your workflow.

Feel free to share this document with whoever makes the decisions about product, cash flow, or business improvement in your organisation!

WHY?

Firstly, why bother checking bank account data?

Staggeringly, it's often wrong! A survey by Pay.uk, the organisation that runs the UK BACS system revealed that **71% of failed Direct Debit Instructions happen due to incorrect sort code and account numbers**.

When DDs fail, the business has to spend time, and money in chasing the customer, updating the data, and re-sending the instruction to BACS. Not only this, the customer is often left frustrated, which can affect customer retention and loyalty.

Pay.uk's survey stated that two-thirds of companies need to **spend at least £50 per failed transaction** to rectify the problems.

Checking that bank account data is valid up front solves both these challenges.

HOW?

Your business needs to focus on what it does best, adding value to your customers and clients.

Bank sort code data changes each week, and the algorithms to validate account numbers are updated regularly too. Handling this yourself is possible, but it needs constant maintenance.

Using a third party API to validate this data removes this overhead, allowing you to focus on your core business.

The third party takes ownership of the raw bank data and algorithms, keeping them updated behind the scenes. Your business integrates by sending requests, and getting the validation status back.

WHAT?

At mintly we offer a fast, scalable and reliable Software-as-a-Service (SaaS) solution for checking sort codes and account numbers.

We use the latest data available from Vocalink and combine that with the same algorithms that banks use to generate account numbers to validate the data we receive from our customers.

Our APIs send back the valid or invalid status to help you get the data right first time. We also provide the branch data associated with the sort code, and the payment types that the branch supports. This ensures that the customer's account supports the payment types you need.

DETAILS

- Our API is always available 24/7/365 and hosted in the cloud
- Our service scales as you do
- Industry standard security used end-to-end to protect data
- Ultra fast response times from our APIs to give the best experience
- OpenAPI 3.0 standards compliant API, to help software engineers get started faster
- Example code on our website to help you get started
- Valid accounts return the address and supported payment types of the branch
- Error statuses and messages provide useful feedback if incorrect data used
- Track your usage using our online portal

PRICING

mintly offers three plans to suit businesses of all sizes. We have a fixed monthly fee for each plan, which includes a bundle of free requests - our free tier. After that you can pay as you go, per request.

All of our plans come with a 14-day free trial, so you can try our service completely free with no risk.

If you need something more bespoke we can craft a plan that suits your business.

Plan	Standard Plus	Professional	Enterprise
Free requests	10,000	25,000	Unlimited
Secure API	✅	✅	✅

User Portal	✅	✅	✅
Request throttle	10 per second	100 per second	1000 per second
Price per request	1.2p	1.06p	< 1p
Price per month	**£96**	**£212**	**£POA**

Pricing example: A customer subscribed to our Standard Plus plan uses 12,400 requests in a month. Their bill that month would be £121.44. £96 (our fixed fee for the plan) plus £25.44 for the additional 2,400 requests.Price excludes VAT.

GET STARTED

To get started on your bank account validation journey, simply sign up to one of our plans, or contact us about a bespoke plan. We can help you get set up and our support team is on hand to handle any questions.

We can even help with integration into your existing systems. Get in touch to speak with our team.
